

Figure 1. A schematic diagram illustrating the experimental design. The figure shows a sequence of events starting from a participant's arrival at the laboratory. The participant is first informed about the experiment and then given a practice trial. This is followed by three main trials: a baseline trial, a treatment trial, and a follow-up trial. Each trial involves a series of steps: a pre-test, a test, and a post-test. The baseline trial is used to establish a control level of performance. The treatment trial involves the application of a specific intervention. The follow-up trial is used to assess the long-term effects of the treatment. The diagram also indicates the timing of data collection and analysis.
